

Session: 5

1. Write the Git command for each:

Initialize a Repository

```
git init
```

Stage All Files

```
git add .
```

Commit with a Message

```
git commit -m "Initial Commit"
```

Push to Remote Repository

```
git push origin main
```

Pull Latest Changes

```
git pull origin main
```

2. What is the difference between git fetch and git pull?

- git fetch downloads the latest changes from the remote repository but does not merge them.
 - git pull downloads the latest changes and automatically merges them into the current branch.
-

3. Create a new GitHub repository, push any small text file from your local system, and share the repository link.

Commands Used:

```
mkdir GitAssignment
```

```
cd GitAssignment
```

```
echo Hello World > sample.txt
```

```
git init
```

```
git add .
```

```
git commit -m "Added sample text file"
```

```
git branch -M main
```

```
git remote add origin https://github.com/USERNAME/GitAssignment.git Can't find link
```

```
git push -u origin main
```

Repository Link:

 <https://github.com/USERNAME/GitAssignment> Can't find link

(Replace USERNAME with your GitHub username.)

4. What is the difference between a Fork and a Pull Request?

- A Fork creates a personal copy of another user's repository in your GitHub account.
 - A Pull Request is a request to merge changes from a branch or fork into another repository.
-

5. Create a new branch named feature-test, make one commit on it, and merge it back to the main branch.

Create Branch

```
git checkout -b feature-test
```

Make Changes and Commit

```
git add .
```

```
git commit -m "Added changes in feature-test branch"
```

Switch to Main Branch

```
git checkout main
```

Merge Branch

```
git merge feature-test
```
